

## These Selected Findings are part of a larger report: <br> What's It Worth?: The Economic Value of College Majors.

In the full report, readers can find detailed information about earnings, broken down by 171 different undergraduate majors and a variety of demographic factors. The study also analyzes the likelihood that students in specific majors going on to graduate school, and which occupations and industries they can expect to work in. The report covers everyone with Bachelor's degrees in the U.S. economy, not just recent graduates.

## Selected Findings from What's It Worth: The Economic Value of College Majors

In the United States today, there is no more certain investment than a college education. On average, college graduates make 84 percent more over a lifetime than their high school-educated counterparts. Until now, though, that overall number has been virtually the only information available on the economic benefits of a college education. If you wanted to know specifics about what, say, an English degree might mean in the labor market, you were largely out of luck. But not anymore. For the first time, the Georgetown University Center on Education and the Workforce has tackled that issue head on, with a detailed analysis of earnings and employment outcomes for different undergraduate majors.

What's It Worth demonstrates just how critical the choice of undergraduate major is to a student's potential earnings. While everyone who attends college can expect a significant return on their investment, different undergraduate majors lead to markedly different careersand significantly different wages. In one of the most extreme examples, for instance, the report finds that Counseling Psychology majors make median earnings of $\$ 29,000$ per year, compared to \$120,000 for Petroleum Engineering majors.

The full report also looks at a host of other factors, broken down by specific majors, that can affect potential earnings, including gender, race and ethnicity. In some cases, the findings are stark. Gender inequality, as expressed in pay differences, is rampant across virtually every major. For example, even in one of the highest-earning majors for women (Chemical Engineering), women still make \$20,000 less per year than men. The report also highlights some glaring racial and ethnic earnings gaps. For instance, African-Americans who graduate with a Finance major earn an average of \$47,000 per year, which is less than Hispanics (\$56,000) and Asians (\$56,000) - and much less than Whites (\$70,000).

What's It Worth also details the relationship between undergraduate majors and graduate degree attainment - and analyzes the commensurate boost in earnings an advanced degree can provide. The report shows, for instance, that 25 percent of Liberal Arts majors obtain graduate degrees, compared with 47 percent of Mathematics majors. However, Mathematics majors reap a 33 percent earnings boost from a graduate degree, while Liberal Arts majors gain 42 percent.

The full report also provides in-depth information about where Bachelor's degree holders work by occupation and industry, telling readers whether people who have an Engineering major actually work in Engineering - and what happens to Liberal Arts degree holders when they are in the labor market.

In the Selected Findings, we have aggregated the 171 majors into 15 large groups and provided relevant data on earnings, graduate degree attainment, and demographic characteristics. This data covers not just recent graduates, but all workers with Bachelor's degrees in the U.S. economy.' Our findings make it clear that while getting a degree matters, there is significant variation depending on which major you pick.

We have categorized 171 undergraduate majors into the following aggregate groups:

- Agriculture and Natural Resources
- Arts
- Biology and Life Science
- Business
- Communications and Journalism
- Computers and Mathematics
- Education
- Engineering
- Health
- Humanities and Liberal Arts
- Industrial Arts and Consumer Services
- Law and Public Policy
- Physical Sciences
- Psychology and Social Work
- Social Science
' All data is the authors' analysis of the 2009 American Community Survey.

The most popular major group is Business, with 25 percent of all students; the least popular are Industrial Arts and Consumer Services and Agriculture and Natural Resources, with 1.6 percent each.

The highest median earnings are found in the Engineering major group (\$75,000), while the lowest are the Education and Psychology and Social Work groups (\$42,000). Women with an undergraduate major in the Social Science group have the largest earnings differentials, making \$18,000 less than men with these majors (followed closely by Engineering and Physical Sciences, where women earn \$17,000 less than their male counterparts). There are racial/ethnic differences, too. For example, the median earnings for Whites with an undergraduate major in Engineering (\$80,000) are higher than those for Asians (\$72,000), African-Americans (\$60,000), Other Races (\$57,000), and Hispanics (\$56,000). However, in Health, Law and Public Policy, Psychology and Social Work, and Biology and Life Science, Asians make more than Whites.

The major groups that have the greatest concentrations of women are Health ( 85 percent), Education (77 percent), and Psychology and Social work (74 percent), while the major groups with the highest concentrations of men are Engineering (84 percent) and Agriculture and Natural Resources (70 percent). The major group with the highest concentrations of Whites is Agriculture and Natural Resources (90 percent). The highest concentration of Asians can be found in Computers and Mathematics (16 percent), while the highest concentration of African-Americans is in Law and Public Policy (14 percent). Law and Public Policy also has the highest concentration of Hispanics (1o percent).

The likelihood of obtaining a graduate degree varies significantly by major group. Students in the Biology and Life Science group are the most likely to obtain an advanced graduate degree ( 54 percent do so), while those in the Communications and Journalism and Industrial Arts and Consumer Services major groups are the least likely (only 20 percent do so), followed closely by Business ( 21 percent).

However, returns to these graduate degrees vary. Although we do not know which graduate degree someone with a particular major earned, we do know how much more they make with one. Biology and Life Science majors, for instance, make $\$ 35,000$ more at the median with a graduate degree, while the difference in median earnings for terminal Bachelor's degree holders and graduate degree holders with an undergraduate major in Arts is only \$11,000.

In addition, different majors lead to different industries. For example, while 43 percent of Law and Public Policy majors end up in Public Administration, only 13 percent of Social Science majors do so-and a higher portion of Social Science majors actually end up in Finance (16 percent).

The tables and figures that follow provide detailed information on the popularity of each major, the median earnings for those with a terminal Bachelor's degree, median earnings for those with a graduate degree, the percent of a particular major obtaining a graduate degree, median earnings by race/ethnicity and gender, the racial/ethnic and gender composition of majors, and where majors end up by industry.
